PC Tasks – Detecting Impending Disk Failure

15) With the System log open, look for an entry in the “Source” column named “Atapi”, “Disk” or “Ntfs”. If “Atapi” or “Disk” is there, it is likely that your hard disk is failing, and needs to be replaced (“Cloned” to a new disk). Most computer professionals can do this for you. The type of message may be “Error” or “Warning”. Note: “Atapi” can also refer to problems with CD or DVD drives as well, but its presence should be checked to be safe.

If “Ntfs” is there in the “Source” column, then your disk’s file structure is corrupt, and you must run the thorough disk checking/repair utility.

- 4) The “Event Properties” window is not shown because all errors of this type require serious attention. Double-clicking the line item will open the “Event Properties” window and allow you see more detail, if you wish.
